

Sec. 15.1-B: Double integral as an iterated integral

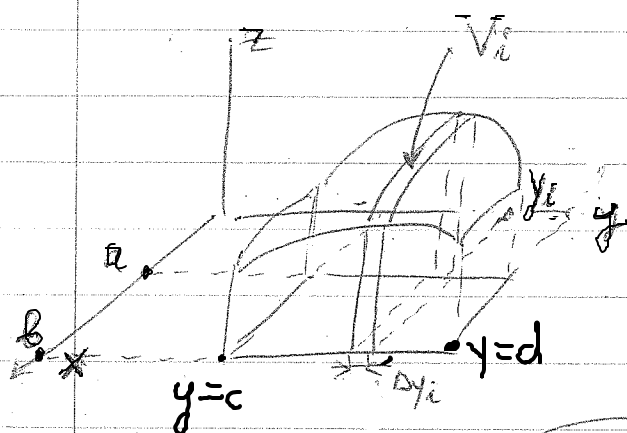

① Main result

We need a method to evaluate double integrals.
Here we do it under 2 assumptions:

- 1) The domain R is a rectangle whose sides are $\parallel$ to the x - and y -axes;

- 2) $f(x, y)$ is continuous.

$$R = [a, b] \times [c, d]$$

We start from

$$\iint_R f(x, y) dA = V, \quad (1)$$

$$V = \sum_i V_i, \quad \text{where the } (2)$$

→ slice V_i is shown.

$$\text{Now, } V_i = \text{base} \cdot \text{height} = (\text{face area}) \cdot \Delta y_i \quad (3)$$

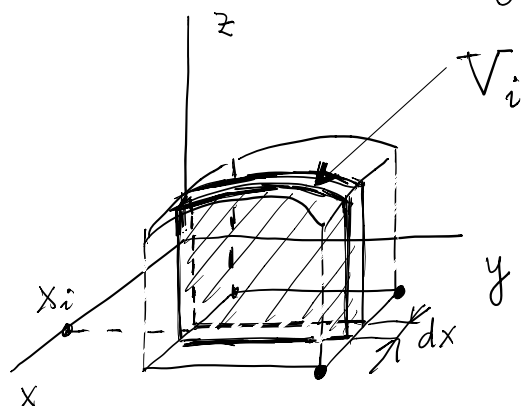

$$\begin{aligned} \text{face area} &= \text{Area under } f(x, y_i) \text{ for } x \in [a, b] \\ &= \int_a^b f(x, y_i) dx \end{aligned} \quad (4)$$

Put (1) - (4) together:

$$\iint_R f(x, y) dA = V = \sum_i V_i \approx \sum_i \left(\int_a^b f(x, y_i) dx \right) \Delta y_i,$$

$$\Rightarrow \iint_{[a, b] \times [c, d]} f(x, y) dA = \int_c^d \left(\int_a^b f(x, y) dx \right) dy$$

However, by the same token, we could have sliced the volume along the y -axis:

$$\iint_{[a,b] \times [c,d]} f(x,y) dA$$

$$= \int_a^b \left(\int_c^d f(x,y) dy \right) dx$$

Fubini's Thm: Let $R = [a,b] \times [c,d]$ and $f(x,y)$ is continuous on R . Then:

$$\iint_R f(x,y) dA = \int_c^d \left(\int_a^b f(x,y) dx \right) dy = \int_a^b \left(\int_c^d f(x,y) dy \right) dx$$

- In practice, one performs the easier integration first. (I.e., use the more convenient order of integration.)
- When integrating over x , treat y as const, and vice versa.

Ex. 1 Find the volume bounded by the surface $z = y^3 \sin(xy^2)$ and the xy -plane over the rectangle $R = [0, \pi] \times [0, 1]$ (i.e., $0 \leq x \leq \pi$, $0 \leq y \leq 1$).

Sol'n: 0) In almost all problems in Chap. 15, we (= you!) need to make a sketch before doing anything else. However, in this problem, we don't.

These exceptional cases where you do not need to sketch, will be announced. **By default, you need to sketch!**

1) Integration over y would require a u -substitution $u = y^2$ followed by integration by parts. Possible, but not easy.

2) So we try to integrate over x first.

$$\iint_R y^3 \sin(xy^2) dA = \int_0^1 \underbrace{\left(\int_0^\pi y^3 \sin(xy^2) dx \right)}_{\text{Inner } \int} dy$$

$$\text{Inner } \int = \int_{x=0}^{x=\pi} \underbrace{y^3}_{\text{const!}} \sin u \cdot \underbrace{\frac{du}{y^2}}_{\text{function of } x \text{ only!}}$$

$$= \int_{x=0}^{x=\pi} y \cdot \sin u \cdot du$$

$$= y \cdot \int_{x=0}^{x=\pi} \sin u \cdot du = y \cdot (-\cos u) \Big|_{x=0}^{x=\pi}$$

$$= y \cdot (-\cos(xy^2)) \Big|_{x=0}^{x=\pi}$$

$$= -y (\cos(\pi y^2) - \overbrace{\cos(\pi \cdot 0^2)}^1) = y (1 - \cos(\pi y^2)).$$

$$\begin{aligned} u &= xy^2 \\ &\uparrow \text{function of } x \text{ only!} \\ du &= y^2 \cdot dx \\ &\uparrow \text{const, when taking } x\text{-derivative} \\ dx &= du / y^2 \end{aligned}$$

Note: We explicitly indicated that the limits were for x , not u , even though we integrated over u .

By default, when we integrate over u , the limits would be for u .

Later we will practice u -sub for limits.

$$3) \text{ Outer } \int = \int_0^1 y (1 - \cos(\pi y^2)) dy = \underbrace{\int_0^1 y dy}_{I_1} - \underbrace{\int_0^1 y \cos(\pi y^2) dy}_{I_2}$$

$$I_1 = \int_0^1 y dy = \frac{y^2}{2} \Big|_0^1 = \frac{1}{2}$$

19-4

$$I_2 = \int_0^1 y \cos(\pi y^2) dy =$$

$$= \int_{y=0}^{y=1} \cos u \frac{du}{2\pi} = \frac{\sin u}{2\pi} \Big|_{y=0}^{y=1}$$

$$= \frac{\sin(\pi y^2)}{2\pi} \Big|_{y=0}^{y=1} = \frac{\sin(\pi \cdot 1) - \sin 0}{2\pi} = 0.$$

$$u = \pi y^2$$

$$du = \pi \cdot 2y dy$$

$$(du = \frac{du}{dy} \cdot dy)$$

do not drop!

$$y dy = du / (2\pi)$$

Combine: $\iint_R f(x,y) dA = \text{Outer} \int = \frac{1}{1/2} - \frac{1}{0} = \frac{1}{2}.$

See also Ex. 5, 6, 7 in book.

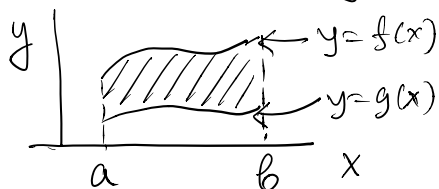

② Special case: If $f(x,y) = f_1(x) f_2(y)$

$$\Rightarrow \int_a^b \int_c^d f_1(x) f_2(y) dy dx = \int_a^b f_1(x) dx \cdot \int_c^d f_2(y) dy.$$

See Ex. 8 in book.

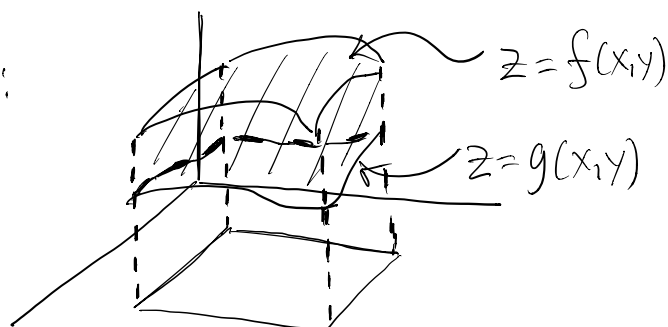

③ Volume bounded by $z = f(x,y)$ & $z = g(x,y)$

Calc. I:

$$\text{Area} = \int_a^b (f(x) - g(x)) dx.$$

Calc. III:

$$\text{Volume} = \iint_R (f(x,y) - g(x,y)) dA$$
