

QUIZ for MATHEMATICA Lab 1

September 16, 2026

General Instructions

- Since Mathematica commands are case-sensitive, your work must *unambiguously* distinguish between the upper- and lower-case letters. In the event of ambiguity, I will interpret your letter case the “wrong” way.
- Exactly the same rule applies to using the correct kind of brackets, i.e., $(\dots)$, $[\dots]$, or $\{\dots\}$.
- You need to present only the “bare-bone” version of the command requested. That is, you can omit cosmetic options such as, e.g., `AspectRatio -> Automatic`, etc.
